

IN THE CLAIMS

Please amend the claims as follows.

1. (Currently Amended) A method of forming a gate oxide on a transistor body region, comprising:
evaporation depositing a substantially amorphous and substantially single element metal layer directly contacting [[on]] the body region using electron beam evaporation, the metal being chosen from the group IVB elements of the periodic table; and
oxidizing the metal layer to form a metal oxide layer directly contacting [[on]] the body region.
2. (Original) The method of claim 1, wherein evaporation depositing the metal layer includes evaporation depositing a zirconium layer.
3. (Canceled)
4. (Original) The method of claim 3, wherein electron beam evaporation depositing the metal layer includes electron beam evaporation of a 99.9999% pure metal target material.
5. (Original) The method of claim 1, wherein evaporation depositing the metal layer includes evaporation depositing at an approximate substrate temperature range of 150 - 400 °C.
6. (Original) The method of claim 1, wherein oxidizing the metal layer includes oxidizing at a temperature of approximately 400 °C.
7. (Original) The method of claim 1, wherein oxidizing the metal layer includes oxidizing with atomic oxygen.

8. (Original) The method of claim 1, wherein oxidizing the metal layer includes oxidizing using a krypton (Kr)/oxygen (O₂) mixed plasma process.
9. (Currently Amended) A method of forming a gate oxide on a transistor body region, comprising:
 - evaporation depositing a substantially amorphous and substantially single element metal layer directly contacting [[on]] the body region using electron beam evaporation, the metal being chosen from the group IVB elements of the periodic table; and
 - oxidizing the metal layer using a krypton(Kr)/oxygen (O₂) mixed plasma process to form a metal oxide layer directly contacting [[on]] the body region.
10. (Original) The method of claim 9, wherein evaporation depositing the metal layer includes evaporation depositing a zirconium layer.
11. (Canceled)
12. (Original) The method of claim 11, wherein electron beam evaporation depositing the metal layer includes electron beam evaporation of a 99.9999% pure metal target material.
13. (Original) The method of claim 9, wherein evaporation depositing the metal layer includes evaporation depositing at an approximate substrate temperature range of 150 - 400 °C.
14. (Currently Amended) A method of forming a transistor, comprising:
 - forming first and second source/drain regions;
 - forming a body region between the first and second source/drain regions;
 - evaporation depositing a substantially amorphous and substantially single element metal layer directly contacting [[on]] the body region using electron beam evaporation, the metal being chosen from the group IVB elements of the periodic table;
 - oxidizing the metal layer to form a metal oxide layer directly contacting [[on]] the body region; and

coupling a gate to the metal oxide layer.

15. (Original) The method of claim 14, wherein evaporation depositing the metal layer includes evaporation depositing a zirconium layer.

16. (Canceled)

17. (Original) The method of claim 16, wherein electron beam evaporation depositing the metal layer includes electron beam evaporation of a 99.9999% pure metal target material.

18. (Original) The method of claim 14, wherein evaporation depositing the metal layer includes evaporation depositing at an approximate substrate temperature range of 150 - 400 °C.

19. (Original) The method of claim 14, wherein oxidizing the metal layer includes oxidizing at a temperature of approximately 400 °C.

20. (Original) The method of claim 14, wherein oxidizing the metal layer includes oxidizing with atomic oxygen.

21. (Original) The method of claim 14, wherein oxidizing the metal layer includes oxidizing using a krypton (Kr)/oxygen (O₂) mixed plasma process.

22. (Currently Amended) A method of forming a memory array, comprising:

forming a number of access transistors, comprising:

forming first and second source/drain regions;

forming a body region between the first and second source/drain regions;

evaporation depositing a substantially amorphous and substantially single element metal layer directly contacting [[on]] the body region using electron beam evaporation, the metal being chosen from the group IVB elements of the periodic table;

oxidizing the metal layer to form a metal oxide layer directly contacting [[on]] the body region;

coupling a gate to the metal oxide layer;

forming a number of wordlines coupled to a number of the gates of the number of access transistors;

forming a number of sourcelines coupled to a number of the first source/drain regions of the number of access transistors; and

forming a number of bitlines coupled to a number of the second source/drain regions of the number of access transistors.

23. (Original) The method of claim 22, wherein evaporation depositing the metal layer includes evaporation depositing a zirconium layer.

24. (Canceled)

25. (Original) The method of claim 24, wherein electron beam evaporation depositing the metal layer includes electron beam evaporation of a 99.9999% pure metal target material.

26. (Original) The method of claim 22, wherein evaporation depositing the metal layer includes evaporation depositing at an approximate substrate temperature range of 150 - 400 °C.

27. (Original) The method of claim 22, wherein oxidizing the metal layer includes oxidizing at a temperature of approximately 400 °C.

28. (Original) The method of claim 22, wherein oxidizing the metal layer includes oxidizing with atomic oxygen.

29. (Original) The method of claim 22, wherein oxidizing the metal layer includes oxidizing using a krypton (Kr)/oxygen (O₂) mixed plasma process.

30. (Currently Amended) A method of forming an information handling system, comprising:
- forming a processor;
 - forming a memory array, comprising:
 - forming a number of access transistors, comprising:
 - forming first and second source/drain regions;
 - forming a body region between the first and second source/drain regions;
 - evaporation depositing a substantially amorphous and substantially single element metal layer directly contacting [[on]] the body region using electron beam evaporation, the metal being chosen from the group IVB elements of the periodic table;
 - oxidizing the metal layer to form a metal oxide layer directly contacting [[on]] the body region;
 - coupling a gate to the metal oxide layer;
 - forming a number of wordlines coupled to a number of the gates of the number of access transistors;
 - forming a number of sourcelines coupled to a number of the first source/drain regions of the number of access transistors;
 - forming a number of bitlines coupled to a number of the second source/drain regions of the number of access transistors; and
 - forming a system bus that couples the processor to the memory array.
31. (Original) The method of claim 30, wherein evaporation depositing the metal layer includes evaporation depositing a zirconium layer.
32. (Canceled)
33. (Original) The method of claim 32, wherein electron beam evaporation depositing the metal layer includes electron beam evaporation of a 99.9999% pure metal target material.
34. (Original) The method of claim 30, wherein evaporation depositing the metal layer includes evaporation depositing at an approximate substrate temperature range of 150 - 400 °C.

35. (Original) The method of claim 30, wherein oxidizing the metal layer includes oxidizing at a temperature of approximately 400 °C.

36. (Original) The method of claim 30, wherein oxidizing the metal layer includes oxidizing with atomic oxygen.

37. (Original) The method of claim 30, wherein oxidizing the metal layer includes oxidizing using a krypton (Kr)/oxygen (O₂) mixed plasma process.

38. - 50. (Canceled)

51. (Currently Amended) A transistor formed by the process, comprising:
forming a body region coupled between a first source/drain region and a second source/drain region;
evaporation depositing a substantially amorphous and substantially single element metal layer directly contacting [[on]] the body region using electron beam evaporation, the metal being chosen from the group IVB elements of the periodic table;
oxidizing the metal layer to form a metal oxide layer directly contacting [[on]] the body region; and
coupling a gate to the metal oxide layer.

52. (Original) The transistor of claim 51, wherein evaporation depositing the metal layer includes evaporation depositing a zirconium layer.

53. (Canceled)

54. (Original) The method of claim 51, wherein oxidizing the metal layer includes oxidizing using a krypton (Kr)/oxygen (O₂) mixed plasma process.

55. (Currently Amended) A method of forming a gate oxide on a transistor body region, comprising:

electron beam evaporation depositing a substantially amorphous and substantially pure zirconium layer directly contacting [[on]] the body region; and

oxidizing the zirconium layer to form a metal oxide layer directly contacting [[on]] the body region.

56. (Previously Presented) The method of claim 55, wherein oxidizing the zirconium layer includes oxidizing a zirconium layer to form an oxide with a conduction band offset in a range of approximately 5.16 eV to 7.8 eV.

57. - 61. (Canceled)
